

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Introduction

The following Management's Discussion & Analysis ("MD&A") of Sokoman Minerals Corp. ("Sokoman" or the "Company") for the three and six months ended December 31, 2021 has been prepared to provide material updates to the business operations, liquidity and capital resources of the Company since its last annual management's discussion & analysis, being the Management's Discussion & Analysis ("Annual MD&A") for the fiscal year ended June 30, 2021. This MD&A does not provide a general update to the Annual MD&A, or reflect any non-material events since the date of the Annual MD&A.

This MD&A has been prepared as of February 25, 2022, in compliance with section 2.2.1 of Form 51-102F1, in accordance with National Instrument 51-102 – Continuous Disclosure Obligations. This discussion should be read in conjunction with the Annual MD&A, audited consolidated financial statements of the Company for the years ended June 30, 2021 and 2020, together with the notes thereto, and unaudited condensed interim consolidated financial statements of the Company for the three and six months ended December 31, 2021, together with the notes thereto. Results are reported in Canadian dollars, unless otherwise noted. The Company's unaudited condensed interim consolidated financial statements and the financial information contained in this MD&A are prepared in accordance with International Financial Reporting Standards ("IFRS") as issued by the International Accounting Standards Board and interpretations of the IFRS Interpretations Committee. The unaudited condensed interim consolidated financial statements have been prepared in accordance with International Accounting Standard 34, Interim Financial Reporting.

The technical information of this MD&A has been reviewed and approved by Mr. Timothy Froude, P. Geo., a Qualified Person as defined by National Instrument 43-101.

Description of Business

Sokoman is a public company listed on the TSX Venture Exchange (TSXV-SIC and the OTCQB-SICNF) operating under the laws of the Province of British Columbia. The Company is an exploration-stage Company that is in the process of exploring its mineral properties located in Canada and has not yet determined whether these properties contain reserves that are economically recoverable. The Company's registered head office is 82 Richmond Street East, Toronto, Ontario M5C 1P1.

Mineral Properties

Moosehead Gold Property

History

The property consists of 98 claims optioned from Altius Minerals in 2018 with 7,754,371 common shares and 1,428,571 share purchase warrants issued with the purchase warrants at a strike price of \$0.05 / share, expiring March 17, 2021. The property is also subject to a 2% Net Smelter Return ("NSR") including 1.5% to the vendor and a 0.5% NSR to an arms-length 3rd party. A condition of purchase was that the Company incurs \$500,000 in exploration expenditures within twelve (12) months with the Company exceeding the required minimum expenditures in the first 12 months, receiving the transfer of ownership in February 2019.

The property is an easily accessible, orogenic lode gold property where historic sampling has returned high-grade values of up to 442 g/t Au from boulders and up to 170 g/t Au over 1.53 metres from drill core. The mineralized system remains virtually untested below a vertical depth of 150 metres with the only "deep hole" intersecting 278 g/t Au over 0.50 m at a core depth of 257 m. Mapping of bedrock and mineralized veins in a trench on the Western trend by Altius indicated that the controlling Au-bearing structures for this area are oriented E-W and WNW, whereas most historic drill holes targeted N-S structures.

At the time of the option only the Western Zone was known on the property in spite of exploration by numerous companies over the previous 20 plus years. Since acquiring the project, and discovering the

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Eastern Zone with the first hole (MH-18-01), drilled under the narrow high grade target mentioned in paragraph 2 above, significant gold intersections have been reported from all 6 drilling phases, with mineralization defined over a 500 m strike length and a 200 m vertical height, remaining open along strike and to depth, in what is now known as the Eastern Trend, In addition, other gold zones, the Footwall Splay, South Pond, and 75 Zone have been discovered during follow up of previous work and extensive drilling.

The gold mineralization at Moosehead is similar in style and grade to the world-class Fosterville Mine in Victoria State, Australia, and it establishes Moosehead, like New Found Gold's Queensway property, as a Fosterville lookalike, which is well supported by geological and structural criteria.

South Pond Zone - Gold mineralization was discovered in quartz float along the northern shore of South Pond by earlier workers and was further evaluated by Sokoman in the summer of 2020. This resulted in the discovery of two types of mineralized float, a high-grade cluster that averaged 36.59 g/t Au, and the previously known, lower-grade cluster, that averaged 1.91 g/t Au (**NR July 30, 2020**). Drilling in 2020 located significant gold values below the mineralized boulders. The zone has been traced by drilling over a 125 m strike length, to a depth to 80 m (from surface), and a width of at least 3 m remaining open along strike and to depth. Modeling suggests that it may be the southern extension of the Western Zone, located 240 m to the north.

Exploration

Exploration, primarily drilling, has taken place in Phases as funding and results allowed. Phase 1-5 drilling totals: 23,219 m in 106 holes with 97 focused on the Western (25), and Eastern Zones (72) – Hole #'s MH-18-01-MH-20-98, 9 recce (MH-19-101-109). **Note: # MH-19-38 number was not used.*

The table below shows the highest gold intersections from the first 5 phases.

Phase 1	MH-18-01	11.90 m @ 44.96 g/t Au, incl. 5.65 m @ 93.56 g/t Au
Phase 2	MH-18-39	5.10 m @ 124.20 g/t Au, incl. 1.10 m @ 550.30 g/t Au
Phase 3	MH-19-62	7.20 m @ 22.35 g/t Au, incl. 4.80 m @ 33.59 g/t Au
Phase 4	MH-19-81	6.40 m @ 17.34 g/t Au, incl. 1.45 m @ 75.50 g/t Au
Phase 5	MH-20-86	5.20 m @ 16.85 g/t Au, incl. 1.35 m @ 61.11 g/t Au

**Reported lengths are core lengths believed to be 70% - 90% of true thicknesses.*

A drill hole plan and longitudinal can be found at:

<https://sokomanmineralscorp.com/2020/05/15/sokoman-minerals-completes-extended-phase-5-drilling-program-at-moosehead-central-newfoundland/>

Phase 6 Drilling

The Phase 6 drilling program commenced on September 14, 2020 and is ongoing at this time. The amount of drilling in Phase 6 was increased on three occasions in 2021, most recently on November 10, and is now proposed to total 100,000 metres. Currently there are 3 drills at work on the Moosehead Project including one drill based on a barge in North Pond. A fourth drill rig, which was temporarily diverted to drill a month long program at Grey River is currently offline for scheduled maintenance and will return to the Moosehead Project in early December, 2021. The drilling will continue until paused for the Christmas break. Total meterage in Phase 6 to date of this MD&A is approximately 40,000 m in 209 holes.

Phase 6 drilling highlights include:

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

- Eastern Zone / Footwall Splay - MH-20-115 - two high-grade zones - the Footwall Splay, 4.60 m @ 47.20 g/t Au, and a deeper Main Eastern Trend - 8.10 m @ 68.25 g/t Au (**NR Nov. 19, 2020**);
- South Pond Zone - MH-20-123 - 5 m @ 26.88 g/t Au including 2.15 m @ 60.59 g/t Au, the presumed in-situ source of the high-grade boulder cluster (July 2020) which averaged 36 g/t Au (**NR Dec. 17, 2020**)
- FW Splay – high-grade, near-surface, intersections such as:
 - MH-20-132 - 4 m at 24.92 g/t Au, incl 1.60 m at 61.68 g/t Au - 70.50 m downhole (NR - Jan. 29/21)
 - MH-21-157 - 3.50 m at 12.39 g/t Au, incl. 1.50 m at 28.57 g/t Au - 36.30 m downhole
 - MH-21-163 - 11.60 m at 21.07 g/t Au, incl. 5.10 m at 30.82 g/t Au - 44.0 m downhole – 25 m stepout
 - MH-21-166 - 5.10 m at 15.51 g/t Au, incl. 2.80 m at 27.68 g/t Au - 9 m downhole – 40 m stepout - *collared in a visible gold-bearing quartz vein* - (**NR April 28, 2021**)

South Pond

In 2020, drilling beneath the high-grade boulder cluster intersected a quartz vein zone at 47 m that averaged 26.87 g/t Au over 5 m, including 60.59 g/t Au over 2.15 m (MH-20-123), the likely in-situ source of the high-grade boulders (**NR December 17, 2020**). The Au mineralization occurs in a 3-7 m wide zone of shearing and quartz veining, with 2-5% disseminated sulphides (pyrite+/-sphalerite+/-boulangerite) with the high-grade sections typically banded and/or stylonitic, locally vuggy, quartz veins, up to one metre thick, with multiple 1 to 5 mm blebs of visible gold in a zone of moderately sheared siltstones. Drilling continues to expand the near surface zone in step out drilling as follows:

- MH-21-141 - 15 m N of MH-20-123 - 4.20 m at 64 g/t Au, incl. 1.20 m at 223.63 g/t Au from 47.90 m downhole (*reported lengths are core lengths and are believed to be 90% of true thickness*)
- MH-21-140 - 15 m S of MH-20-123, - 6.70 m at 3.24 g/t Au, incl 1.20 m at 16.96 g/t Au from 42 m downhole (**NR Feb. 23, 2021**)
- A new, near-surface, mineralized structure was intersected in 2 holes, MH-21-152, 153 (**NR April 28, 2021**). The second mineralized structure (Z-2) lies approximately 50 m east of the South Pond zone (Z-1). Drill holes MH-21-152 and 153, the furthest holes to the south and east at South Pond, both intersected shallow, near surface, shearing and veining similar in style and mineralogy (boulangerite, arsenopyrite, sphalerite) to higher grade intersections at Moosehead without the VG. The vein style and mineral assemblage is indicative of the “high-grade” veining intersected in the Z1 zone including MH-20-123 (5.00 m of 26.87 g/t Au), and MH-21-141 (4.20 m of 64.00 g/t Au). The 2 intersections at Z2 gave the following results:
 - MH-21-152 – 3.00 m of 1.82 g/t Au including 0.70 m of 3.08 g/t Au from 15.00 m downhole;
 - MH-21-153 – 3.00 m of 1.61 g/t Au including 1.60 m of 2.40 g/t Au from 12.00 m downhole;

The drilling has expanded the strike length of the mineralized zone to 125 m, the depth to 80 m (from surface), and the width to at least 3 m, with the zone remaining open along strike and to depth.

In early August 2021, the Company announced the arrival of the third drill rig to test high-priority targets in the 75 Zone and Eastern Trend areas, where 15,000 m of the remaining 27,000 m in the current phase will be done (**NR August 10, 2021**). Diamond drilling was concentrated on the Eastern Trend / Footwall splay at North Pond, the 75 zone and the South Pond zone. The barge-based drill program testing the intersection of the Footwall Splay and the Main Eastern Trend, a structural setting scenario similar to the high-grade Eagle/Swan Zone at Fosterville, began in September 2021.

Approximately 40,000 m of the planned 50,000 m, Phase 6, program has been completed (as of August 10, 2021) with multiple gold intersections reported including higher grade values in the holes summarized below:

- MH-21-115 (Footwall Splay – Eastern Trend) – 4.60 m @ 47.20 g/t Au; and 8.10 m @ 68.25 g/t Au
- MH-21-163 (Footwall Splay – Eastern Trend) – 18.90 m @ 13.09 g/t Au
- MH-21-141 (South Pond Zone 1) – 4.20 m @ 64.00 g/t Au

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

- MH-21-123 (South Pond Zone 1) – 5.00 m @ 26.87 g/t Au
- MH-21-203 (75 Zone) – 2.85 m @ 13.67 g/t Au

More exhaustive results from the drilling are shown below in the table.

DDH #	Length m	Az.	Dip	Target		From (m)	To (m)	Length m*	Au (g/t)	G x M	Visible Gold

* Core lengths - believed to be 70-90% of reported lengths.

Eastern Trend / Footwall Splay

Eastern Trend - Infill and step-out drilling in Q4 resulted in the following mineralized intersections (**NR July 6, 2021**):

- MH-21-178 tested the Upper Eastern Trend assaying 4.72 g/t Au / 1.10 m from 30.20 m downhole, 25 m vertically below surface.
- MH-21-191, gave 21.86 g/t Au / 3.60 m incl. 43.47 g/t Au / 1.80 m at a downhole depth of 244 m, a 9 m step-out from MH-16-62 which gave 22.35 g/t Au / 7.20 m incl. 33.59 g/t Au / 4.80 m.

Footwall Splay – The Footwall Splay has a 175 m N-S strike length over a minimum width of 25 m. Drill results (**NR's July 6 and 20, 2021**) included:

- MH-21-115 – 4.60 m @ 47.20 g/t Au; 8.10 m @ 68.25 g/t Au;
- MH-21-163 – 18.90 m @ 13.09 g/t Au;
- MH-21-167 collared in a visible-gold-bearing vein, assaying 2.94 g/t Au / 1.2 m, extending the FW splay 27 m south from MH-21-157 (12.39 g/t Au / 3.5 m, incl. 28.57 g/t Au / 1.50 m from 36.3 m downhole).

Drill holes MH-21-193, 198 and 200 focused on the Lower Eastern Trend between 150 to 200 m vertical as a follow-up to holes MH-19-62 (7.20 m @ 22.35 g/t Au and MH-19-81 (6.40 m @ 17.34 g/t Au). The results confirm the continuity of the gold mineralization in the Lower Eastern Trend (**NR July 29, 2021**).

Previous drilling in the Eastern Trend intersected gold mineralization on structures both above and below the main mineralized envelope. Ongoing close-spaced drilling of the Lower Eastern Trend indicates that there is more regularity and predictability to these intersections. The upcoming barge-based program will be key to assessing the up-plunge potential and whether these structures prove to be additional high-grade splays and or parallel structures.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

75 Zone

The 75 zone is a mineralized block which lies 100 m NE of the South Pond zone, approximately halfway to the Eastern Trend, which intersected 5.80 m of 6.93 g/t Au, incl, a VG bearing vein grading 32.99 g/t Au / 0.80 m in MH-19-75 starting at 87.50 m downhole (**NR July 29, 2021**). The intersection included two visible gold-bearing veins that gave 30.42 g/t Au / 0.30 m (from 88.95 m), and 32.99 g/t Au / 0.80 m (from 92.50 m). The initial follow-up program around MH-19-75 was based on 25 m step outs which has been determined to be less than ideal in evaluation of these complex shear systems. Two drill holes gave significant values as follows:

- MH-21-203 – 13.67 g/t Au / 2.85 m from 98.15 m downhole – a 10 m step out south from MH-19-75.
- MH-21-205 – intersected 4 veins with visible gold, giving 2.88 g/t Au / 4.25 m incl 7.89 g/t Au / 1.25 m – a 15 m step out from MH-19-75 (and up-dip from MH-21-203)

The zone remains open with the drilling planned to help determine whether it is a new splay / zone or is possibly the southern extension of the Eastern Trend.

South Pond Zone

Drilling has extended the mineralized zones up and down dip with DDH MH-21-190 extending the “high-grade” intersection in MH-21-123 (5 m of 26.87 g/t Au) 11 m up dip, and DDH MH-21-184 extending the near-surface mineralized zone, discovered in MH-21-152 (3.0 m of 1.82 g/t) 15 m down dip (NR July 6, 2021). Another high grade intersection was found in MH-21-141 which gave 4.20 m @ 64 g/t Au (**NR July 20, 2021**). The style of veining and mineral assemblage (boulangerite, arsenopyrite and sphalerite) is similar to the “high-grade” zones in MH-21-190.

The drilling has defined a steeply-plunging, high-grade gold core in a moderately to steeply east-northeast dipping mineralized zone which has been traced 65 m along strike and from surface to 95 m down dip, remaining open both along strike and down dip. Modelling suggests the zone is possibly a splay off the Eastern Trend structure to the east, with many similar characteristics to the original Footwall Splay at North Pond. This interpretation bodes well for continued exploration between South Pond and Western Trend (approximately 250 m corridor) not only for gold mineralization on the main structures but for repeating splays as well.

Prospecting

Prospecting at South Pond, 400 metres along strike, to the south of the Eastern Trend zone, in 2020 located a cluster of angular quartz float boulders with grab sample assay results ranging from 0.318 to 157.04 g/t Au, with silver values up to 36.2 g/t Ag (**NR July 30, 2020**) in angular quartz float (from 0.2 to 0.5 m maximum dimension) from the northern end of South Pond. Three (3) samples contained visible gold (VG). Antimony (Sb), a key pathfinder metal for high-grade mineralization at Moosehead and at the Fosterville deposit in Australia, was noted.

Follow-up prospecting, taking advantage of low water levels in the summer, carried out in the area of angular quartz boulders located in fall 2020, 300 m to the east of North Pond, located quartz boulders with arsenopyrite and lesser boulangerite and sphalerite, with multiple sights of fine visible gold, 20 m from the original cluster. These newly discovered boulders gave two high values of 14.81 g/t and 9.36 g/t Au (NR July 6, 2021). Similar mineralized boulders with visible gold were also located in brooks 250 m to the northeast.

The boulders lie along a prominent northeast-trending structural lineament in the east-central portion of the property and coincide with strong, linear magnetic and VLF-EM anomalies. Three widely-spaced drill holes, completed earlier this year in the general area, did not adequately test this near-surface target. Additional

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

drilling was proposed and in late summer, the 253 Zone discovery was announced representing the potential in situ extension of the aforementioned float. Assay results are pending.

In November 2021, the Company announced the first results from the barge based program which included several significant assay intervals including 4.95 m of 27.70 g/t Au from DDH MH-21-291. Other highlights are shown in the table.

DDH #	Depth	Az.	Dip	Target		From (m)	To (m)	Length m*	Au (g/t)	G x M	Visible Gold

MH-21-291	72	287	-76	Eastern Trend		41.55	46.50	4.95	27.70	137.10	Y
					incl	41.55	43.35	1.80	45.73	82.31	Y
* Lengths are core lengths and believed to be 90% true thickness.											

Outlook

Phase 6 drilling began in September 2020 and is ongoing testing the Eastern Trend, Western Trend, South Pond Trend, as well as newly recognized zones including the 75 Zone and 253 Zone. The Barge based program will be instrumental in delineating the Upper Eastern Trend and Footwall Splay as well as helping connect the 75 Zone with the Main Eastern Trend to the south of North Pond. Periodically one rig will test outlying high-priority geochemical and recently discovered till geochemical and prospecting targets.

The outlook for the Project continues to be extremely favourable, as ongoing drilling has been successful in extending the known zones as well as identifying new targets and recent modelling has identified previously overlooked areas for infill as well as expansion drilling. especially with the recently discovered ET FW splay, the continuity being shown at the South Pond trend and continued excellent results at the main Eastern Trend as we continue to expand high-grade gold mineralization to the northeast, southwest and to depth in more than one zone. The understanding of the geometry of the mineralization has given new insight into the structural controls of the high-grade mineralization of the Eastern and Western Trends and has also helped with discoveries such as those at South Pond. Other recent till geochemical and prospecting discoveries have also shown that other parts of the overburden covered property remain very prospective and will continue to be tested in the Phase 6 drilling. Phase 6 drilling to December 31, 2021 has seen 41,394 m drilled in 237 holes. A further 58,000 m remains in the current program. Drilling resumed in January 2022 with 2 drills with a third to be added by end of February 2022.

Fleur de Lys

History

The Company acquired in February 2021, by staking and option agreements, the Fleur de Lys Project of 1,891 claims (47,275 hectares) on the Baie Verte Peninsula of NW NL, targeting Dalradian-Style Orogenic Gold. The new project presents a district-scale project of 475 sq. km in an analogous geological setting to the multi-million-ounce gold deposit in Northern Ireland (Curraghinalt). The acquisition was the result of two years of research and recce exploration in the area. The property has the following attributes:

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

- The Fleur de Lys group is the geological equivalent to the Dalradian belt in the Northern UK Caledonides, N. Ireland and Scotland, host to 6 million oz* Curraghinalt Deposit.
- Sokoman tills, taken in 2019/20, have given up to 122 gold grains with >35% pristine
- Unexplained gold anomalies in government lake sediments / tills
- 98% of property is 100% owned, acquired by staking, with no royalties or payments
- Limited historic exploration: virtually none since late 1990s; only 1 drill hole for gold; gold in bedrock values from 3.3 to 25.5 g/t gold - not drilled
- Excellent infrastructure including hundreds of kilometres of paved secondary highways and forest-access roads
- Mining-friendly jurisdiction – in top-ten of Fraser Institute's (2020) global mining jurisdictions

The area is highly prospective for Dalradian-style (e.g., Curraghinalt) orogenic vein-hosted gold deposits and is a readily accessible, yet underexplored, district-scale, gold target in the Newfoundland Appalachians. The property is underlain primarily by Late Precambrian-Early Cambrian metasedimentary rocks of the Fleur de Lys Supergroup, cut by a regional suite of Silurian intrusions. The Fleur de Lys terrane lies immediately to the west of the Baie Verte – Brompton Line (BVBL), a major Appalachian-Caledonian crustal-scale structure, marked by ultramafic remnants of ophiolite complexes. The structure and adjoining continental margin/volcanic arc rocks extend to the northwest from Newfoundland into the Caledonian orogen in Northern Ireland and Scotland (UK). Similar metamorphosed and deformed continental margin sediments, equivalent to the Fleur de Lys Supergroup, occur in the same tectonic position relative to the BVBL in northern UK, and contain structurally controlled, vein-hosted orogenic gold deposits such as Curraghinalt in Northern Ireland and Cononish in Scotland. Curraghinalt (Dalradian Gold/Orion Mine Finance) is a high-grade, 6-million-ounce deposit*, the largest gold deposit in the Appalachian-Caledonian orogen.

The property has seen little modern exploration, with some areas remaining completely unexplored. Historic work by Noranda, other smaller companies, and individual prospectors documented polymetallic (Cu, Pb, Mo) quartz veins with high silver values, gold (including visible gold), pyrite and arsenic-rich alteration, in structurally controlled quartz veins, veinlets and vein-breccias, that cut psammitic, pelitic and graphitic Fleur de Lys metasediments, to the west of the BVBL. Grab sample values of 3.3 g/t Au to 25.5 g/t Au are reported from several locations (Jacobs, 1991; Basha, 1999). (*historical assays have not been verified by the Company and should not be relied upon*)

Exploration

Reconnaissance till sampling by Sokoman in 2019/20 over the “then” Crown Land in the Fleur de Lys belt defined multiple gold targets, in 129 C-horizon till samples processed by Overburden Drilling Management (ODM) in Ottawa for gold grain analysis. Results gave 38 samples with >20 grains, 14 samples with >40 grains with a maximum of 122 gold grains with many samples with a high percentage (30-80%) of pristine grains, suggesting a local, probably less than a 1 km, source for the gold.

The Phase 1, property-scale, till C-Horizon till sampling program which began in June 2021, has been completed under contract by Overburden Drilling Management (ODM) in Ottawa with ODM doing the gold grain and heavy mineral analysis and contract crews taking the samples. Prospecting has been ongoing concurrent with the till sampling, and approximately 60+ rock samples have been submitted for assay, many with disseminated pyrite and chalcopyrite, minerals linked to several gold-enriched deposits in the UK, including the six-million-ounce Curraghinalt deposit in Northern Ireland, with which the Fleur de Lys project shares many characteristics. Most samples have in excess of 1% pyrite (iron sulphide), chalcopyrite (copper sulphide), or galena (lead sulphide). All rock sample are pending assays.

A total of 968 till samples were collected on lines 1.5 to 2 km apart with 250 m sample spacing along the lines. Gold grain counts have been received for 400 samples with multiple anomalies identified (**NR October 6, 2021**). The table below shows the number of samples reporting anomalous results.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Fleur de Lys - Phase 1 - C Horizon Tills			
20 grains +	40 grains +	60 grains +	80 grains +
109	28	12	3

Based on discussions with ODM, background gold grain counts are 10 grains per sample with an anomalous sample considered to be 2X background or 20 gold grains. Of the 400 results received to date, 109 contain at least 20 gold grains with the two highest gold grain counts, 111 and 116 grains, with 90 and 84 pristine grains respectively, suggesting a local source (less than 200 m). A follow up program of infill tills, based on the results to date, has begun. Preliminary results have been received for an additional 320 samples with results being compiled. Field work was suspended in December 2021 due to winter conditions. Field work will restart in the Spring however compilation of results and historical exploration is ongoing.

Options

The company has two optioned properties for additional claims to the Fleur de Lys project (**NR June 21, 2021**). The option agreements are described below:

Duffitt Option – SIC can earn a 100% interest in six licenses (51 claims) subject to a 2% NSR royalty with a buyback of 1% for \$1M any time prior to production. Details of the option agreement are:

- 1) A \$20,000 deposit (paid);
- 2) Issue 75,000 shares of SIC on TSX Venture Exchange approval;
- 3) Pay \$20,000 cash and issue 100,000 shares on or before the first anniversary of the Option Agreement;
- 4) Pay \$25,000 cash and issue 100,000 shares on or before the second anniversary of the Option Agreement;
- 5) Pay \$35,000 cash and issue 175,000 shares on or before the third anniversary of the Option Agreement.
- 6) Issue 500,000 shares if/when a NI 43-101 compliant “inferred” mineral resource of a minimum of 100 K ounces of gold, or gold equivalent, is established on the Property.

Squires / McGuire Option – SIC can earn a 100% interest in license 03128M (29 claims) on NTS 12H/16, subject to a 2% NSR royalty with a 1% buyback for \$1M any time prior to production. Details of the option agreement are:

- 1) Pay a deposit of \$5,000 (paid);
- 2) Issue 25,000 shares on Exchange approval;
- 3) Pay \$10,000 cash and issue 50,000 shares on or before the first anniversary date of this Option Agreement;
- 4) Pay \$15,000 cash and issue 75,000 shares on or before the second anniversary date of this Option Agreement
- 5) Pay \$20,000 cash / issue 100,000 shares on or before the third anniversary of this Option Agreement.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

East Alder

History

The property is strategically located along the Valentine Lake / Moosehead regional structure with the following attributes:

- Float grab rock samples with values from 0.1 g/t to 5.3 g/t Au; trace to 10.8% Cu;
- 2-kilometre gold-in-soil trend continuous with the gold-in-soil anomaly on Canterra's Wilding Project;
- Covers 30 claims (7.5 km²) of the NE strike extension of the Valentine Lake Shear Zone that controls gold mineralization at Wilding Lake and Marathon Gold's Valentine Lake project;
- Drill permits are in place;

Exploration

Sokoman has carried out very limited exploration, consisting of prospecting and soil geochemistry, on the property since its acquisition. Au in soil anomalies have been defined but not followed up.

The Company has been informed by Canterra that exploration completed in 2021 included an airborne LiDAR survey, the collection of 356 soil samples and limited trenching with expenditures totaling approximately \$100,000 on the East Alder Property. Results have not yet been made public and Canterra hasn't announced exploration plans for 2022.

Options

The property consists of 30 claims in two licenses optioned by the Company under two separate agreements, one with Benton Resources Inc., and the second with a private consortium (Unity Resources). The Benton property was acquired for an initial share payment of 1 million shares on signing and \$1,500 in cash (paid). On January 3, 2019, the second anniversary of the agreement, 500,000 common shares were issued. Benton retains a 2% NSR of which 1% can be purchased for \$1 million. In addition, SIC has payments of \$600,000 in cash/shares due at project milestones as follows:

- 1) \$100,000 payment upon completion of a NI 43-101 compliant resource in cash/shares/or mix;
- 2) \$200,000 payment upon completion of a pre-feasibility in cash/shares/or mix;
- 3) \$300,000 payment upon completion of final/full/bankable feasibility.

The Unity option terms are:

On Signing; 750,000 shares of Sokoman and \$5,000.00 cash;

1st Anniversary; 650,000 Shares of Sokoman;

- 1) Vendors retain a 2% NSR with a buyback of 1% for \$ 1,000,000.00 cash.
- 2) Work Commitment - Sokoman or assigns to keep claims in good standing. Sokoman retains the right to drop or reduce claims as deemed appropriate. First right of refusal on dropped/reduced claims to vendors.
- 3) \$100,000 payment upon completion of a N143- I 0 I compliant resource in cash/shares/or mix;
- 4) \$200,000 payment upon completion of a pre-feasibility in cash/shares/or mix;
- 5) \$300,000 payment upon completion of a final/full/bankable feasibility;
- 6) Upon termination of this agreement the claims must be returned with 6 month good standing.
- 7) Vendors will receive consideration for equipment rentals at competitive pricing.

Canterra Minerals

The Company announced on April 19, 2021 that the project had been optioned to Canterra Minerals Corp. The property is contiguous with, and immediately NE of, and contiguous with, Canterra's Wilding Project in central Newfoundland. Canterra can acquire a 100% interest in the Project, subject to a 1% NSR with buy

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

back of 0.5% for \$1,000,000 to Sokoman, by issuing 750,000 common shares and work commitments of \$600,000 over 4 years with the underlying option terms also payable by Canterra.

Crippleback Lake Property

History

The Property is located in north-central Newfoundland easily accessible by a network of secondary logging roads. It covers the northeastern extension of the regional-scale Valentine Lake fault zone and lies roughly midway between the Valentine Lake gold deposits (Marathon Gold) and Sokoman's Moosehead Gold Project in the emerging Central Newfoundland Gold Belt. Sokoman acquired the property in late 2016, through a combination of staking (130 claims) and option (30 claims). The vendors of the optioned claims retain a 2% NSR with a buyback of 1% for \$1 million and will also receive 10% of the value of any third-party transaction Sokoman completes on the property.

Exploration

Mineralized rock samples include quartz veins and altered intrusive, volcanic, and sedimentary rocks, all of which exhibit varying degrees of sericite/silica/sulphide (mainly pyrite) alteration and mineralization. Several carry disseminated chalcopyrite and galena as well as malachite (copper oxide) staining. Multiple areas of anomalous soils and gold grain counts from tills, which require mechanized trenching to fully investigate, have been identified.

No exploration has been carried out on the property in 2021 since emphasis was placed on optioning the property given the level of interest in NL's gold potential. The last exploration was carried out in late summer 2020 with detailed till sampling on License 27399M, soil sampling on License 24204M, and prospecting / rock sampling on Licenses 27399M and 24204M. Seventeen till samples were taken from the C-horizon on license 27399M with samples shipped to Overburden Drilling Management in Ottawa for gold grain analysis. Total gold grains ranged from 4 to 32 (sample 456980). The calculated parts per billion (ppb) for gold in the samples ranged from 26 ppb to 2,461 ppb gold (sample 456980). Soil sampling on License 24204M gave anomalous results that coincide with two high gold in till samples from the 2016 program. The highest value was 35 ppb Au in sample 400773 which corresponds to 2016 till sample CLT-27 with 20 gold grains. The second highest gold value was 21 ppb from sample 400751 which corresponds to 2016 till sample CLT-26. Limited prospecting in the vicinity of weak to moderate 2019 soil anomalies along the north shore of Caribou Pond in the southwestern portion of the property as well as the northwestern area, with anomalous tills and the soils from 2020 work, were sampled. Ten outcrop samples of weakly mineralized volcanic units with weak pyrite mineralization gave a maximum of 68 ppb Au. Three float samples taken from the north shore of Caribou Pond all gave ND.

The Company has been informed by Trans Canada that exploration in 2021 included a helicopter supported airborne magnetic gradiometer geophysical survey and a limited (8 sample) rock sampling program. Results have not been disclosed to Sokoman and Trans Canada has not yet announced exploration plans for 2022.

Option

The property was optioned to Trans Canada Gold ("Trans Canada") whereby Trans Canada can earn a 100% interest in the property (**NR - June 3, 2021**) by issuing 1,250,000 common shares of Trans Canada and cash and work commitments totaling \$600,000 over a 4-year period. Sokoman will retain a 1.0% NSR royalty, with Trans Canada having the right to buy down 0.5% of the royalty for \$1,000,000. The Option agreement, including the issuance of Trans Canada Gold Shares, is subject to Exchange approval. The Trans Canada shares will be subject to a statutory hold period.

Option Payment Summary:

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

- 1) \$10,000 cash / 250,000 shares within 10 days of the effective date, subject to a six-month escrow period following the Exchange approval:
- 2) \$15,000 cash / 250,000 shares / \$50,000 in exploration on or before the first.
- 3) \$25,000 cash / 250,000 shares / \$100,000 in exploration on or before the second.
- 4) \$25,000 cash / 250,000 shares / \$150,000 in exploration on or before the third.
- 5) \$25,000 cash / 250,000 shares / \$200,000 in exploration on or before the fourth.
- 6) On the Exercise Date, granting Sokoman a 1% NSR royalty, subject to a buydown of 0.5% for \$1,000,000, on the terms and conditions set forth in the Option Agreement.

Sokoman / Benton Strategic Alliance

Sokoman entered into a strategic alliance (the "Alliance") with Benton Resources Inc. ("Benton") (TSXV: BEX) targeting district-scale gold opportunities in Newfoundland, to jointly acquire and explore these opportunities (**NR May 20, 2021**). Each partner has a 50% interest and shares exploration costs 50/50.

The partners acquired by staking, and some small option agreements, the Golden Hope Property in south-central Newfoundland, the Kepenkeck Gold Property in south central NL, and the Grey River Gold Project also in southern Newfoundland.

The Alliance provides Sokoman with an excellent opportunity to reduce exploration risk, employ the technical expertise of Benton, and strengthen Sokoman's project portfolio while retaining focused on the Moosehead and Fleur de Lys projects. Sokoman is now one of the largest land holders in Newfoundland with direct ownership or co-ownership of over 150,000 hectares (+6,000 claims).

Exploration is carried out either by both parties, with costs shared equally, or individually by each Company with the other Company invoiced for their portion of the costs.

Golden Hope JV

History

The property, a 3,176-claim (79,400 ha / 794 km²) in 18 licenses is located in southwestern Newfoundland in the same general area as the Hope Brook mine now owned by Big Ridge Gold Corporation. It covers extensions of two major structures linked to significant gold prospects and deposits in southern Newfoundland, related to new orogenic gold discoveries in central Newfoundland, including Sokoman's 100%-owned Moosehead Project and NewFound Gold's Queensway Project.

The property lies along the northwestern margin of the Hermitage Flexure, a structurally complex region with diverse mineral endowment which is the predominant geological feature of the southern Newfoundland Appalachians. The most prominent structures on the Property, the focus of exploration, are a linked system of west-verging thrust faults (Bay D'Est Fault Zone) and a transverse, wrench fault system (Gunflap Hills Fault Zone). These fault zones can be gold-bearing, with correlative rock units / structures, elsewhere in Newfoundland, a focus of gold exploration and the site of major gold discoveries (e.g. Central Newfoundland Gold Belt). Historical exploration in the western Hermitage Flexure region led to major gold discoveries at Hope Brook and Cape Ray, currently under advancement by First Mining/Big Ridge Gold and Matador Mines respectively, spurring the first systematic gold exploration in west central Newfoundland.

The remainder of the west-central Hermitage Flexure has remained underexplored, despite gold occurrences, unsourced gold in till, soil and stream sediment geochemical anomalies, and linkages between southern and central Newfoundland. The JV is transected by the paved Burgeo highway and a major power transmission line.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Exploration

Exploration has consisted of three phases to date which has located mineralized rock samples with gold potential (results pending) and previously unknown, strong lithium (Li) values in pegmatites.

A reconnaissance, helicopter supported, evaluation resulted in the acquisition of grab rock samples for both gold and Li and associated elements, stream sediment and C-horizon till samples and a 5,709 line km Heliborne High-Resolution Aeromagnetic & Matrix Digital VLF-EM Survey flown by Terraquest Ltd. (**NR Aug. 16, 2021**) with the data currently being processed. The airborne survey will provide the structural / lithological setting and help identify gold-bearing structure extensions, as well as any unrecognized structures including those potentially related to the lithium pegmatites.

Mineralization included occurrences of structurally controlled quartz veins with variable pyrite, and a previously unreported zone of arsenopyrite / pyrite as stringers and veinlets comprising up to 10% of the rock of unknown strike length and up to 30-40 m thick. Approximately 50 rock samples, 7 stream sediment and 4 C-horizon till samples were submitted for analyses and/or processing – results are pending for all samples except the Li bearing rock samples (see description following).

The initial evaluation by Benton's President / CEO Stephen Stares and Director Michael Stares, along with Sokoman's President / CEO Timothy Froude and consultant Sean O'Brien, discovered a swarm of lithium-bearing pegmatite dikes (**NR August 16, 2021**), taking three grab samples over a 110-m-width across the dykes. Two of the samples gave 1.95% Li₂O and 0.49% Li₂O, believed to be the first discovery of significant lithium mineralization on the Island of Newfoundland. The lithium mineralization is situated in a so-far unknown-sized zone or swarm of pegmatite dykes with an apparent width of 110 m and as-yet unknown strike length. Lithium occurrences in the Appalachian belt are well known and include important deposits in the Carolinas in the eastern US, as well as in the geologically equivalent Caledonides of Ireland.

Random grab samples were also taken near the northern and southern limits of the zone with analyses for 35 of 58 follow-up grab and chip samples collected over a 1 km² area, received in mid September (**NR Sept 16, 2021**). Eleven (11) samples (31.4%) gave values >1% Li₂O with 3 >2% Li₂O, and a high of 2.37% Li₂O. The dominant Lithium-bearing mineral appears to be spodumene (LiAl(SiO₃)₂) which occurs as clusters of elongated prismatic crystals up to 5-cm-long in a grey-white matrix of glassy quartz and feldspar and a pale-green to white mica (see photo of sample 361716). Multiple samples from the aplite dikes give highly-anomalous Cesium (17 to 508 ppm Cs), Rubidium (226 to 1310 ppm Rb) and Tantalum (5 to 179 ppm Ta), typical of evolved pegmatite swarms. Samples 361715-718 were a series of 0.5 m² composite samples from the discovery outcrop that measures 10m x 3m and is 100% pegmatite. The dike margins are overburden covered and width of the dike is not known. All other samples were taken over the broader mineralized area. Beryllium values, 2 grab samples grading >5000 ppm Be, with others ranging from 6 ppm to >5000 ppm Be, with associated anomalous Lithium, Cesium, Rubidium and Tantalum were also located. These samples, mineralogy unknown, are located approximately 2 km to the west of the Li discovery, providing further evidence that it is an evolved pegmatite system.

Additional results are pending (23 samples) along a 1 km strike of pegmatites. The Lithium, Beryllium, Cesium, Rubidium and Tantalum values are located up to 2 km to the west of the initial discovery.

Prospecting in early October expanded the area containing lithium-bearing pegmatite dykes, now known as "The Kraken Pegmatite Swarm", to approximately 2.2 km-long by 0.85 km-wide. (**NR October 14, 2021**).

Prospecting focused to the east of the original discovery where multiple areas of spodumene-bearing pegmatites dykes ranging from 0.5 m to 10.0 m in thickness form possible stacked swarms striking approximately 50 degrees and dipping 45-65 degrees east with unknown strike length. Fifty five (55) samples from the eastern-half of the swarm area were taken and assays are pending.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

A second phase of sampling from a till covered area, west of the original discovery, of sub-crops and large local boulders, gives anomalous rubidium, tantalum and lithium values with large, angular, purple coloured (lepidolite), pegmatite boulder located 600 m west of the original lithium zone grading 1.04% Li₂O.

A third sampling phase evaluated an area to the north and northwest of the initial discovery with results released in November 2021 (add NR date) with 17 of 50 samples reporting from 0.23% Li₂O to 2.15% Li₂O with over limit assaying pending.

The sampling has demonstrated that the dyke system contains economic lithium values, is widespread, and is open along and across strike.

Outlook

Follow up exploration includes detailed geological mapping / a high-resolution drone survey that will include imagery, lidar and magnetic datasets to assist in the mapping and targeting the dyke system. Permits for a 10-20 hole diamond drill program has been applied for and drilling could begin as early as early 2022, subject to weather conditions.

Kepenkeck

History

The Kepenkeck Gold Property (595 claims / 15,625 ha) in east-central Newfoundland near the NE extension of the Hermitage Flexure, and along trend from Canstar Resources' Golden Baie Property in the central Newfoundland Gold Belt (**Benton NR dated May 6, 2021**). It was acquired in separate 2 option deals. The target is high grade gold in quartz veins, hosted in graphitic shales similar to that of the New Found Gold property to the northwest. The property has new road access, little historical work, and favourable geology and is located on a major structure.

Prospecting by the vendors (the Keats) discovered multiple quartz veins and silicified zones with sulfides (chalcopyrite and galena) with gold values up to 2.45 g/t in grab samples, and visible gold in panned tills in two locations on the property.

Benton Resources acquired the Keats option because of new road access, little historical work and due to the Project being situated in prospective geology along a major trend that hosts several high-grade gold zones to the south and west. The property was subsequently blended into the joint Benton-Sokoman exploration Alliance. Recent prospecting completed by Keats identified gold in grab samples, from trace values up to 2.45gpt, along with visible gold noted from panning till in two locations on the property.

Exploration

Exploration by the operator, Benton Resources, has consisted of prospecting / mapping, a detailed soil sampling program and a Heliborne High-Resolution Aeromagnetic & Matrix Digital VLF-EM Survey at 100 m line spacing, totaling 1,984 line-km flown by Terraquest Ltd. Assay results for 24 float / outcrop samples acquired during the evaluation gave gold values ranging from <5 ppb to 5,340 ppb obtained. Follow up soil sampling and prospecting has been completed with results pending. Further ground exploration including prospecting, geological mapping and soil and/or till geochemistry is planned for the first half of 2022.

Options

Benton Resources announced on June 29/21 that they, on behalf of the Alliance, had optioned the Larry's Pond project which lies along the western boundary of the Kepenkeck Gold JV claims (**NR June 29, 2021**). The property consists of two licenses totaling 30 claims. The Optionors retain a 2% NSR royalty, half of which, Benton, on behalf of the Joint Venture, can purchase for CAD\$1M at any time. Benton, on behalf

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

of the Joint Venture, on approval from the TSX Venture Exchange, will issue 200,000 common shares and make cash payments of \$60,000 as described below. Under the terms of the Joint Venture, Sokoman will reimburse Benton for 50% of the Option payment costs made by Benton pursuant to the Option Agreement.

- 1) paying \$10,000 cash on execution of the Agreement;
- 2) issuing 50,000 shares of Benton upon receipt of Exchange approval of the Agreement;
- 3) paying \$10,000 cash / issuing 50,000 shares of Benton by the first anniversary;
- 4) paying \$10,000 cash / issuing 50,000 shares of Benton by the second anniversary;
- 5) paying \$30,000 cash / issuing 50,000 shares of Benton by the third anniversary.

Outlook

The Alliance anticipates that the initial exploration will generate targets for further exploration. Results will be released as they are received and compiled to allow planning for follow up.

Grey River

History

The Grey River property in southern Newfoundland, consists of 324 claims (8,100 ha) in 7 licenses, centered on the community of Grey River, a deep-water, ice-free harbour on the south coast, 32 km east of the town of Burgeo, and 38 km southeast of the Golden Hope property (**NR May 27, 2021**).

The claims straddle an east-west trending ductile shear zone that separates a large enclave of Late Precambrian amphibolite, gabbro, metasediments, felsic metavolcanics and mafic orthogneisses from a batholith-scale, syn-kinematic suite of Siluro-Devonian granitoid rocks. The amphibolite-grade metamorphic units are correlatives of the coeval basement block exposed on-strike, farther west in the Hermitage Flexure, near Burgeo and at Hope Brook. The east-west shear zone at Grey River, and parallel structures immediately offshore, are crustal breaks, along which several metal-rich mid- to late-Devonian granites were emplaced along the south coast of the Island. Rocks in this segment of the Hermitage Flexure are unusually enriched in gold (Au), molybdenum (Mo), copper (Cu), tungsten (W), fluorine (F) and bismuth (Bi). A 5 by 10 km long area in and adjoining the property, between Grey River and Gulch Cove, is particularly metal-rich, hosting: i) multiple mesothermal and intrusion-related Au-rich (+/- Bi-Ag-Sb-Pb-Zn) quartz veins; ii) a porphyry Mo-Cu deposit (Moly Brook); iii) a vein-type wolframite-rich W deposit (Grey River #10); and iv) a unique, diffusely bounded, high-purity, locally auriferous silica deposit (Gulch Cove). Each appear to be associated with distinct features in the regional aero magnetics and regional Government lake-sediment geochemistry coverage. The primary focus is quartz-vein-hosted, structurally controlled and intrusion-related, high-grade Au (+/- Ag, Bi, Sb) in both the granitic and adjacent metamorphic terranes.

Previous exploration located gold mineralization in: 1) base-metal-rich and sulfide-poor quartz veins and veinlets in the gneisses, including regional-scale silica bodies; 2) quartz veins with coarse-grained sulfides in granite; 3) sulfide-poor, quartz stock-work in sericitized granite; 4) stockwork-style quartz and quartz-sulfide veinlets with or without pervasive silica replacement in granite. Gold grades from historic grab / channel samples range from <1 g/t to >225 g/t Au, with 200-300 g/t Ag, with or without anomalous Bi, Sb (antimony) and W. The 225 g/t Au chip sample is from a 20-30 cm wide zone of pyritic alteration adjacent to an 8-km-long, diffusely bounded quartz zone - a large, elongated, high-purity silica body (12M tonnes >95% SiO₂), drilled by the Newfoundland Government in 1967 as part of an Island-wide silica assessment program, which lies at the boundary of amphibolite gneisses and mica-schists, and in mica schists, along the flank of a prominent aeromagnetic high. The silica's origin is unclear with past workers proposing different origins (e.g., meta-quartzite; quartz vein; silica replacement zone). The style, grades, setting and Au-Ag-Bi-W-Sb geochemical signature of the gold mineralization is similar to the high-grade Pogo gold mine in the Tintina Gold Belt of Alaska and Yukon (gold in diffusely bounded quartz bodies in amphibolite grade gneisses). The Pogo mine, to the end of 2019, has produced 3.9 million oz gold at a grade of 13.6 g/t gold, with reserves of over 7 million oz gold.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Exploration

A series of grab and chip samples from outcrop and float were taken from various mineralized areas giving assays from not detected (ND) to 134.46 g/t Au w/ sampling focused on an area roughly 500 m by 300 m immediately to the west of Gulch Cove where historical gold values of 225 g/t Au were reported by previous workers (**NR Sept 2, 2021**). A high-grade visible gold-bearing chip sample over 0.5 m (480309) is located a few metres from tidewater and is believed to be the same location as the 225 g/t Au historic sample. This sample also had anomalous bismuth (>1000 ppm Bi), and silver (>6 ppm Ag), with overlimit assaying pending. A second sample (480310), contiguous with sample 480309, gave 3.09 g/t Au from a 30 cm chip. In addition, anomalous values from grab samples ranging from ND to 1.22 g/t Au were returned from sampling a 500 m strike length of the "quartz zone", mapped by the government over an 8 km E-W strike length and up to 300 m wide. Further sampling along this trend to the west has been completed with samples submitted for assay. These remain pending.

Sampling of five archived drill holes, located approximately 2 km east of the high-grade results, drilled for silica by the Newfoundland government in 1968 has been completed. Examination of the cores showed up to 2% disseminated pyrite with no record of gold analyses. A total of 23 samples, ranging from 0.25 m to 2.80 m long, with an average length of 1.21 m, were taken and sent to Eastern Analytical Ltd. in Springdale, NL for Au and ICP analysis. All results are pending.

Drilling started in early October with 1 drill and helicopter support. A total of 1026 m of drilling in five holes was drilled in the program with 643 samples taken and sent to Eastern Analytical in Springdale for gold and ICP analysis. Thirteen (13) samples were Super Rush Fire Assay for Au with results received in late November (Nov. 25, 2021 NR). Six of the samples gave values from 1.34 to 37.64 g/t Au. Highlights include DDH GR-21-01 - 2.35 m of 3.64 g/t Au, incl 1.80 m at 8.56 g/t Au, and 0.35 m at 37.64 g/t Au. The remaining, non-rushed, samples are pending with results expected in March 2022.

Additional drilling will be guided by the results of the first five drill holes, ongoing compilation of the airborne survey and ground exploration planned for the summer.

Options

Sokoman optioned two (2) properties on behalf of the Alliance between the Company and Benton Resources Inc. to add additional claims to the Grey River Gold Property (**NR July 13, 2021**). The vendors are Gary Lewis, Aubrey Budgell and Paul Delaney (Lewis Option) and G2B Gold, United Gold Inc. and Grassroots Prospecting & Prospect Generation Inc. (G2B Gold option). The requirements under the option agreements are described below:

Lewis Agreement – SIC can acquire, on behalf of the Alliance, a 100% interest in seven claims (1 license) subject to a 1.5% NSR royalty with a buyback of 1% for \$1 million at any time. The terms are:

- pay \$10,000 cash on signing;
- issue 50,000 shares of Sokoman on TSX Venture Exchange approval;
- pay \$10,000 cash / issue 50,000 shares of the Company on or before the first anniversary;
- pay \$10,000 cash / issue 50,000 shares on or before the second anniversary;
- pay \$10,000 cash / issue 50,000 shares on or before the third anniversary.

G2B Gold Agreement – SIC can acquire, on behalf of the Alliance, a 100% interest in three licenses (4 claims) subject to a 1.5% NSR royalty with a buyback of 1% for \$1 million at any time. The cash payments and share issuances are to be made equally among G2B Gold, United Gold Inc. and Grassroots Prospecting & Prospect Generation Inc.:

- pay \$10,000 cash on signing;
- issue 50,000 shares of the Company on Exchange approval;
- pay \$10,000 / issue 50,000 shares of the Company on or before the first anniversary;
- pay \$10,000 / issue 50,000 shares of the Company on or before the second anniversary.

Iron Horse

History

The Iron Horse Iron project is located approximately 120 kilometres northeast of Labrador City, Labrador. Sokoman owns 100% interest in the project subject to a 1% NSR to Altius and a 1.9% NSR to Metals Creek.

Exploration

A Phase 1 diamond drilling program, 1,189 m in 5 holes, in the summer of 2012, intersected iron mineralization in all holes with values up to 125 m at 28.28% Fe. A second drilling phase in early September 2012, 1,209 m in 3 holes, tested Anomaly A and extended previously drilled hole GL12-05 by 75 m. Results were reported on November 15, 2012 including the thickest intercept to date, 354 m at 27.75% Fe from GLAA12-02. In May 2013, a 571 line-km airborne gravity survey was carried out over most of the Property by Fugro Airborne Surveys utilizing the Falcon Airborne Gravity Gradiometer system. Results suggest several DSO (Direct Shipping Ore) targets in the Anomaly D area where sampling has given grab sample values in the 53% Fe range. In July 2013, a helicopter supported prospecting program evaluated gravity anomalies from the 2013 airborne gravity survey by reconnaissance prospecting and rock sampling in the Anomaly B and D areas. The sampling located magnetite (taconite) mineralization in the Anomaly D vicinity again suggesting the possibility of DSO iron mineralization.

A core sampling program using a scintillometer to identify radioactive, uranium rich, zones, using archived core from the 2012 drill program, was carried out since Labrador Exploration & Mining had reported uranium mineralization, up to 1800 parts per million, from float samples from the area in 1957. In July 2017, assay results from moderately radioactive core samples in Hole GL-12-02, gave 5 samples with uranium values ranging from 118 to a maximum of 1630 ppm U. The extent of the uranium mineralization is not known, however the values represent the first bedrock occurrence of uranium in the region.

Plans

There are currently no plans to complete any exploration at Iron Horse in the next 3 to 6 months. No exploration is planned for this project since emphasis is on gold and lithium on the island of Newfoundland. Given the interest in iron in western Labrador, and the DSO potential of the property, this is an optionable property and efforts to find an optionee continue.

Financial Highlights

Three months ended December 31, 2021 compared with three months ended December 31, 2020

The Company's net loss totaled \$2,701,407 during the three months ended December 31, 2021, with basic and diluted loss per share of \$0.01. This compares with a net loss of \$759,657 with basic and diluted loss per share of \$0.01 for the three months ended December 31, 2020. The increase in net loss was principally due to:

- Mineral exploration expenses increased to \$2,053,743 for the three months ended December 31, 2021 (2020 - \$570,922) due to increased level of exploration activities in the current period.
- Business development and promotion expenses increased to \$100,379 for the three months ended December 31, 2021 (2020 - \$41,576) due to increased promotional expenses.
- Share-based payments decreased to \$386,937 for the three months ended December 31, 2021 (2020 - \$158,472). Share-based payments will vary from period to period depending on the number of options granted and vested during a period and the fair value of the options calculated on grant date.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Six months ended December 31, 2021 compared with six months ended December 31, 2020

The Company's net loss totaled \$5,908,837 during the six months ended December 31, 2021, with basic and diluted loss per share of \$0.03. This compares with a net loss of \$1,203,718 with basic and diluted loss per share of \$0.01 for the six months ended December 31, 2020. The increase in net loss was principally due to:

- Mineral exploration expenses increased to \$4,601,783 for the six months ended December 31, 2021 (2020 - \$916,894) due to increased level of exploration activities in the current period.
- Business development and promotion expenses increased to \$186,697 for the six months ended December 31, 2021 (2020 - \$95,883) due to increased promotional expenses.
- Share-based payments decreased to \$825,126 for the six months ended December 31, 2021 (2020 - \$159,451). Share-based payments will vary from period to period depending on the number of options granted and vested during a period and the fair value of the options calculated on grant date.

Cash Flow

Cash used in operating activities was \$5,554,053 for the six months ended December 31, 2021. Cash used in operating activities include a net loss of \$5,908,837 for the period, a non-cash adjustment for amortization of \$488, amortization in exploration expenses of \$29,650, share-based payments of \$825,126, unrealized gain on marketable securities of \$33,792, and a net change in non-cash working capital balances of \$534,272 due to changes in amounts receivable, prepaid expenses, security deposit and accounts payable and accrued liabilities.

Cash used in investing activities was \$87,389 for the six months ended December 31, 2021, which comprised of exploration and evaluation assets expenditures of \$18,315 and purchase of property and equipment of \$69,074 during the period.

Cash provided by financing activities was \$161,710 during the six months ended December 31, 2021 from stock options and warrants exercised during the period.

Summary of Quarterly Results

Results for the eight most recently completed quarters are summarized as follows:

Quarter Ended	December 31, 2021 \$	September 30, 2021 \$	June 30, 2021 \$	March 31, 2021 \$
Total assets	12,248,062	14,887,473	17,002,068	6,564,988
Mineral properties	1,018,644	1,000,799	891,622	850,192

Liquidity and Capital Resources

Sokoman is an exploration-stage company focused on identifying, acquiring, and exploring mineral interests. To date, the Company has not derived any revenues from its projects. Acquisition costs of mineral rights and option payments are capitalized until the properties are abandoned or the rights expired. Exploration expenditures are expensed and charged to operations until such time proven reserves are determined. To date, the Company has not discovered any such reserves.

As of December 31, 2021, the Company had current assets of \$11,008,198 (June 30, 2021 - \$15,928,162) and working capital of \$10,325,259 (June 30, 2021 - \$15,282,011).

On September 29, 2021, the Company granted 4,450,000 stock options to officers, directors, employees and consultants of the Company exercisable at a price of \$0.44 per common share. The options vest 1/4 each on grant date and every six months thereafter and expire in five years.

During the six months ended December 31, 2021, a total of 506,050 warrants and 125,000 stock options were exercised for total proceeds of \$134,210 and \$27,500, respectively.

At this time, the Company has sufficient funds to pay for planned exploration expenditures for the next twelve months. In addition, based upon its current cash position, the Company has sufficient liquidity to continue its exploration activities at the current rate of expenditure beyond the next year, with exploration beyond this time frame dependent upon obtaining additional financing. The Company is always assessing its opportunities in this regard and will decide its course of action as its needs arise.

Related Party Transactions

The Company entered into the following transactions with related parties:

- (i) Included in business development and promotion is \$18,750 and \$37,500, respectively for the three and six months ended December 31, 2021 (three and six months ended December 31, 2020 - \$18,750 and \$37,500, respectively) paid to a company related to a director.
- (ii) Included in business development and promotion is \$9,000 and \$18,000, respectively for the three and six months ended December 31, 2021 (three and six months ended December 31, 2020 - \$9,000 and \$18,000, respectively) paid to a director. As at December 31, 2021, \$nil (June 30, 2021 - \$3,545) was owed to this director and this amount was included in accounts payable and accrued liabilities.
- (iii) During the three and six months ended December 31, 2021, the Company incurred legal fees of \$36,094 and \$36,094, respectively (three and six months ended December 31, 2020 - \$25,562 and \$25,562, respectively) included in professional fees and share issuance costs of \$nil and \$nil, respectively (three and six months ended December 31, 2020 - \$8,200 and \$8,200, respectively) to a law firm controlled by the Corporate Secretary.

SOKOMAN MINERALS CORP.
Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

(iv) Included in professional fees is \$17,760 and \$30,126, respectively (three and six months ended December 31, 2020 - \$18,974 and \$32,608, respectively) paid to Marrelli Support Services Inc. ("MSSI") for Eric Myung, an employee of MSSI, to act as the Chief Financial Officer ("CFO") of the Company and bookkeeping services. As at December 31, 2021, \$4,629 (June 30, 2021 - \$2,914) was owed to this company and this amount was included in accounts payable and accrued liabilities.

Key management personnel are those persons having authority and responsibility for planning, directing and controlling the activities of the Company directly or indirectly, including any directors (executive and non-executive) of the Company. Remuneration of directors and key management personnel of the Company, except as noted above, was as follows:

	Three Months Ended December 31, 2021 \$	Three Months Ended December 31, 2020 \$	Six Months Ended December 31, 2021 \$	Six Months Ended December 31, 2020 \$
Salaries and benefits	8,250	17,500	15,250	35,000
Wages and salaries included in mineral exploration expenses	33,000	17,500	61,000	35,000
Directors' fees	5,100	6,600	14,100	13,800
Share-based payments	198,331	97,724	418,705	98,703
	244,681	139,324	509,055	182,503

As at December 31, 2021, \$4,629 (June 30, 2021 - \$14,542) was owed to key management personnel and this amount was included in accounts payable and accrued liabilities.

Off-Balance Sheet Arrangements

As of December 31, 2021, the Company had no off-balance sheet arrangements such as guarantee contracts, contingent interest in assets transferred to an entity, derivative instrument obligations or any obligations that trigger financing, liquidity, market or credit risk to the Company.

Economic Conditions

Due to the COVID-19 pandemic, material uncertainties may arise that could influence management's going concern assumption. Management cannot accurately predict the future impact COVID-19 may have on:

- Global gold prices;
- Demand for gold and the ability to carry out mineral exploration;
- The severity and the length of potential measures taken by governments to manage the spread of the virus, and their effect on labour availability and supply lines;
- Availability of government supplies, such as water and electricity;
- Purchasing power of the Canadian dollar; and
- Ability to obtain funding.

At the date of this MD&A, the Canadian federal government and the provincial government of Newfoundland have not introduced measures that have directly impeded the operational activities of the Company, although assaying of drill core from Moosehead at the Newfoundland based lab has slowed significantly, but remains open. Management believes the business will continue and accordingly, the current situation has not impacted management's going concern assumption. However, it is not possible to reliably estimate the length and severity of these developments and the impact on the financial results and condition of the Company in future periods.

Management's Discussion and Analysis
For the Three and Six Months Ended December 31, 2021

Forward-Looking Statements

This MD&A may contain forward-looking statements that are based on the Company's expectations, estimates and projections regarding the business and the economic environment in which it operates. These statements speak only as of the date on which they are made, are not guarantees of future performance and involve risks and uncertainties that are difficult to control or predict. Examples of some of the specific risks associated with the operations of the Company are set out below under "Risk Factors". Actual outcomes and results may differ materially from those expressed in these forward-looking statements and readers should not place undue reliance on such statements. Additional information related to the Company is available for view on the Company's website located at www.sokomanmineralscorp.com.

Disclosure of Internal Controls

Management is responsible for establishing and maintaining adequate internal control over the Company's financial reporting. The internal control system was designed to provide reasonable assurance to the Company's management regarding the preparation and presentation of the financial statements. The inherent limitations in all control systems are such that they can provide only reasonable, not absolute, assurance that all control issues and instances of fraud or error, if any, have been detected. Therefore, no matter how well designed, ICFR has inherent limitations and can provide only reasonable assurance with respect to financial statement preparation and may not prevent or detect all misstatements. As the Company is a Venture Issuer (as defined under National Instrument 52-109 *Certification of Disclosure in Issuers' Annual and Interim Filings*) ("NI 52-109"), the Company and Management are not required to include representations relating to the establishment and/or maintenance of disclosure controls and procedures ("DC&P) and/or ICFR, as defined in NI 52-109.

Risk Factors

An investment in the securities of the Company is highly speculative and involves numerous and significant risks. Such investment should be undertaken only by investors whose financial resources are sufficient to enable them to assume these risks and who have no need for immediate liquidity in their investment. Prospective investors should carefully consider the risk factors that have affected, and which in the future are reasonably expected to affect, the Company and its financial position. Please refer to the section entitled "Risk Factors" in the Company's Annual MD&A for the fiscal year ended June 30, 2021, available on SEDAR at www.sedar.com.
